

Here is a story where the best laid plans of a science teacher go a bit awry... well, hopefully there's a teaching moment in there somewhere! Enjoy.

The Headline: Science Experiment Leads to Hospital Visit

The storyline: *The good news is that nobody was seriously hurt! An outdoor science experiment left several students and the teacher with mild burns, prompting the teacher to drive them all to the hospital. The cause of the burning? A "drain cleaning substance."*

The science experiment involved placing this mystery substance into water bottle, shaking it up a bit, and then rupturing a hole in the bottle. What comes next is all kinds of fun, so long as you remember to stand back. Apparently, the splattering chemical went a bit further than predicted, and the result was a classroom of students who will now respect the list of safety rules on the walls of the science lab!
