## Grade 4 Academic Standards and Performance Indicators for Science

4.E.2 – Earth Science: Weather and Climate ..... 10

4.E.3 - Earth Science: Stars and the Solar System ..... 21

4.P.4. – Physical Science: Forms of Energy – Light and Sound..... 34

4.L.5. – Life Science: Characteristics and Growth of Organisms..... 50

## ACKNOWLEDGEMENTS

South Carolina owes a debt of gratitude to the following individuals for their assistance in the development of the Grade 4 Curriculum Support Guide for the *South Carolina Academic Standards and Performance Indicators for Science*.

### SOUTH CAROLINA DEPARTMENT OF EDUCATION

The explication of the standards and performance indicators included in this document were developed under the direction of Dr. Cindy Van Buren, Deputy Superintendent, Division of School Effectiveness, Dr. Briana Timmerman, Director, Office of Instructional Practices and Evaluations, and Cathy Jones Stork, Team Leader, Office of Instructional Practices and Evaluations.

The following South Carolina Department of Education (SCDE) staff members facilitated development and revision of this document:

Dr. Regina E. Wragg  
Education Associate  
Office of Instructional Practices and Evaluations

Dr. Deanna Boyd  
Education Associate  
Office of Instructional Practices and Evaluations

### GRADE 4 CURRICULUM DOCUMENT DEVELOPMENT TEAM

The following SC Educators collaborated with the SCDE to develop and draft the *Curriculum Support Guide for the South Carolina Academic Standards and Performance Indicators for Science*, and their efforts and input are appreciated.

Kelli Bellant, Coordinator (Clarendon 2)	Kelly Morse (Saluda)
Bronwen Bethea (Charleston)	Mina Brooks, Coordinator (Newberry)
Cleva Garner (Greenwood)	Jami Cummings, Template Keeper (Spartanburg 7)
Amanda Williamson (Clarendon 2)	Anna MacDermut (EdVenture)
Debbie Bishop, Coordinator (Laurens 55)	Tammy Martin (Horry)
Jason Osborne, Template Keeper (Beaufort)	Mary Robinson (Orangeburg 5)
Amy Elkins (Barnwell 45)	Mirandi O. Squires (Florence 5)
Barbara Koch (Anderson 5)	

### CURRICULUM DOCUMENT REVISION TEAM

The following SC Educators collaborated with the SCDE to review, revise and compile the *Curriculum Support Guides for the South Carolina Academic Standards and Performance Indicators for Science*, and their time, service and expertise are appreciated.

Ed Emmer (Richland 2)	Dana S. Hutto (Lexington 2)
Tonya Smith (Richland 1)	Susan Rhodes (Florence 1)
Michelle Spigner (Richland 2)	Kourtney Shumate (Darlington)
Michael Carothers (Lexington/Richland 5)	Debbie Bishop (Laurens 55)
Jennifer McLeod (Richland 2)	Dominique Ragland (Dorchester 2)
Kelli Bellant (Clarendon 2)	Doreen Gallant Green (Williamsburg)
Chris White (Oconee)	

The SCDE would like to acknowledge the following members from the Office of Assessment at the South Carolina Department of Education (SCDE) for their expertise and assistance with the development of this document:

Dr. Kirsten Hural, Education Associate  
Amelia Brailsford, Education Associate

The SCDE also wishes to thank staff from the Southwest Education Development Laboratory (SEDL) for their assistance with the development of this document:

Don Doggett, Program Associate  
Dr. Sandra Enger, Program Consultant

Working draft

# INTRODUCTION

Local districts, schools and teachers may use this document to construct standards-based science curriculum, allowing them to add or expand topics they feel are important and to organize content to fit their students' needs and match available instructional materials. The support document includes essential knowledge, extended knowledge, connections to previous and future knowledge, and assessment recommendations. Educators may use a feedback form until October 31, 2014 to constructively critique this document and suggest resources and instructional strategies for each performance indicator (see pg. 9).

## ACADEMIC STANDARDS

In accordance with the South Carolina Education Accountability Act of 1998 (S.C. Code Ann. § 59-18-110), the purpose of academic standards is to provide the basis for the development of local curricula and statewide assessment. Consensually developed academic standards describe for each grade and high school core area the specific areas of student learning that are considered the most important for proficiency in the discipline at the particular level.

Operating procedures for the review and revision of all South Carolina academic standards were jointly developed by staff at the State Department of Education (SCDE) and the Education Oversight Committee (EOC). According to these procedures, a field review of the first draft of the revised South Carolina science standards was conducted from March through May 2013. Feedback from that review and input from the SCDE and EOC review panels was considered and used to develop these standards.

The academic standards in this document are not sequenced for instruction and do not prescribe classroom activities; materials; or instructional strategies, approaches, or practices. The *South Carolina Academic Standards and Performance Indicators for Science* is not a curriculum.

## STATEWIDE ASSESSMENT

The science standards and performance indicators for grades four through eight will be used as the basis for the development and/or refinement of questions on the South Carolina Palmetto Assessment of State Standards (SC-PASS) in science. The SC-PASS is based on the broad standards that address the life, earth, and physical science core content at each grade level. Test questions will measure the practice and/or the core content of the performance indicator. In addition, most performance indicators may be assessed with items that utilize any of the science and engineering practices. For example, an assessment item for a performance indicator that requires students to *construct explanations* may also ask students to use other practices such as *asking questions*, *using models*, or *analyzing data* around the core content in the original indicator. Items may also assess students' understanding of the core content without a science and engineering practice.

The high school course standards and performance indicators for Biology 1 will be used as the basis for the state-required End-of-Course Examination Program (EOCEP) for Biology 1.

## GRADE 4 OVERVIEW

In grades three through five, the standards and performance indicators for the science and engineering practices and core science content emphasize students becoming more sophisticated in describing, representing or explaining concepts or ideas. Students use their experiences from structured investigations in kindergarten through grade two to begin planning their own investigations to answer scientific questions. The seven core concepts (patterns; cause and effect; scale, proportion, and quantity; systems and system models; energy and matter; structure and function; and stability and change) are reinforced in the appropriate context of the core science content through hands-on instruction in the classroom.

These academic standards and performance indicators establish the practices and core content for that South Carolina’s students should know and be able to do by the end of grade four.

The four core areas of the grade four standards include:

- Weather and Climate
- Stars and the Solar System
- Forms of Energy – Light and Sound
- Characteristics and Growth of Organisms

The eight science and engineering practices describe how students should learn and demonstrate knowledge of the content outlined in the content standards. Engaging in these practices will help students become scientifically literate and astute consumers of scientific information.

Students should engage in scientific and engineering practices as a means to learn about the specific topics identified for their grade level. It is critical that educators understand the Science and Engineering Practices are *not* to be taught in isolation. There should *not* be a distinct “Inquiry” unit at the beginning of each school year. Rather, the practices need to be employed *within the content* for each grade level.

**KINDERGARTEN****LIFE SCIENCE: EXPLORING ORGANISMS AND THE ENVIRONMENT**

**Standard K.L.2:** The student will demonstrate an understanding of organisms found in the environment and how these organisms depend on the environment to meet those needs.

**K.L.2A. Conceptual Understanding:** The environment consists of many types of organisms including plants, animals, and fungi. Organisms depend on the land, water, and air to live and grow. Plants need water and light to make their own food. Fungi and animals cannot make their own food and get energy from other sources. Animals (including humans) use different body parts to obtain food and other resources needed to grow and survive. Organisms live in areas where their needs for air, water, nutrients, and shelter are met.

**Performance Indicators:** Students who demonstrate this understanding can:

**K.L.2A.1** Obtain information to answer questions about different organisms found in the environment (such as plants, animals, or fungi).

**K.L.2A.2** Conduct structured investigations to determine what plants need to live and grow (including water and light).

*Figure 1: Example from the Kindergarten Curriculum Standards*

The code assigned to each performance indicator within the standards is designed to provide information about the content of the indicator. For example, the **K.L.2A.1** indicator decodes as the following--

- **K: The first part of each indicator denotes the grade or subject.** The example indicator is from Kindergarten. The key for grade levels are as follows—
 

K: Kindergarten	7: Seventh Grade
1: First Grade	8: Eighth Grade
2: Second Grade	H.B: High School Biology 1
3: Third Grade	H.C: High School Chemistry 1
4: Fourth Grade	H.P: High School Physics 1
5: Fifth Grade	H.E: High School Earth Science
6: Sixth Grade	

- **L: After the grade or subject, the content area is denoted by an uppercase letter.** The L in the example indicator means that the content covers Life Science. The key for content areas are as follows—
  - E: Earth Science
  - EC: Ecology
  - L: Life Science
  - P: Physical Science
  - S: Science and Engineering Practices
- **2: The number following the content area denotes the specific academic standard.** In the example, the 2 in the indicator means that it is within the second academic standard with the Kindergarten science content.
- **A: After the specific content standard, the conceptual understanding is denoted by an uppercase letter.** The conceptual understanding is a statement of the core idea for which students should demonstrate understanding. There may be more than one conceptual understanding per academic standard. The A in the example means that this is the first conceptual understanding for the standard.
- **1: The last part of the code denotes the number of the specific performance indicator.** Performance indicators are statements of what students can do to demonstrate knowledge of the conceptual understanding. The example discussed is the first performance indicator within the conceptual understanding.

## FORMAT OF THE CURRICULUM SUPPORT DOCUMENT

The format of this document is designed to be structurally uniformed for each of the academic standards and performance indicators. For each, you will find the following sections--

- **Standard**
  - This section provides the standard being explicated.
- **Conceptual Understanding**
  - This section provides the overall understanding that the student should possess as related to the standard.
- **Performance Indicator**
  - This section provides a specific set of content with an associated science and engineering practice for which the student must demonstrate mastery.
- **Assessment Guidance**
  - This section provides guidelines for educators and assessors to check for student mastery of content utilizing interrelated science and engineering practices.
- **Previous and Future Knowledge**
  - This section provides a list of academic content along with the associated academic standard that students will have received in prior or will experience in future grade levels. Please note that the kindergarten curriculum support document does not

contain previous knowledge. Additionally, although the high school support document may not contain future knowledge, this section may list overlapping concepts from other high school science content areas.

- **Essential Knowledge**
  - This section illustrates the knowledge of the content contained in the performance indicator for which it is fundamental for students to demonstrate mastery. Mastery of the information in the Essential Knowledge section is measured by state-wide assessments in grades four-eight and high school biology 1.
- **Extended Knowledge**
  - This section provides educators with topics that will enrich students' knowledge related to topics learned with the explicated performance indicator.
- **Science and Engineering Practices**
  - This section lists the specific science and engineering practice that is paired with the content in the performance indicator. Educators should reference the chapter on this specific science and engineering practice in the *Science and Engineering Practices Support Guide*.

## EVALUATING THE SUPPORT DOCUMENTS

As part of the development process, the SCDE would like to give the education community an opportunity to provide constructive feedback on the support documents including the grade/subject curriculum guides, 2005 to 2014 indicator crosswalks, and Science and Engineering Practices Guide. You may provide your comments or suggest curriculum resources by accessing the *Academic Standards and Performance Indicators for Science 2014 Support Document Feedback Form* which is available online—

<https://adobeformscentral.com/?f=-fVAZrJqa9jZezpijXmmRg>

You will be able to share only one comment per submission, but you may refresh the form to submit additional comments. The feedback form will close at noon on Oct. 31, 2014. If you have questions regarding this process, please contact Dr. Regina E. Wragg at 803-734-0564 or [rwragg@ed.sc.gov](mailto:rwragg@ed.sc.gov).

## GRADE 4 SCIENCE SUPPORT DOCUMENT

### Standard

**4.E.2:** The student will demonstrate an understanding of the water cycle and weather and climate patterns.

### Conceptual Understanding

**4.E.2A.** Earth's atmosphere is a mixture of gases, including water vapor and oxygen. The movement of water, which is found almost everywhere on Earth including the atmosphere, changes form and cycles between Earth's surface and the air and back again. This cycling of water is driven by energy from the Sun. The movement of water in the water cycle is a major pattern that influences weather conditions. Clouds form during this cycle and various types of precipitation result.

### Performance Indicator

**4.E.2A.1** Obtain and communicate information about some of the gases in the atmosphere (including oxygen, nitrogen, and water vapor) to develop models that exemplify the composition of Earth's atmosphere where weather takes place.

### Assessment Guidance

The objective of this indicator is to *obtain and communicate information* about some of the gases in the atmosphere to *develop models* that exemplify the composition of Earth's atmosphere where weather takes place. Therefore, the primary focus of assessment should be for students to *obtain and evaluate* informational texts to *generate and answer questions* about the atmospheric layers of gases and then to develop models that support and exemplify the understanding of the layers. This could include, but is not limited to students analyzing informational texts and then creating a 2-D or 3-D model of the atmospheric layers with written or oral explanations of the gases and layers.

In addition to *obtaining and communicate information*, students should *ask questions; develop and use models; plan and carryout investigations; analyze and interpret data; use mathematical and computational thinking; engage in scientific argument from evidence; construct explanations; construct devices or design solutions.*

### Previous and Future Knowledge

- 6.E.2 H.E.4 H.E.5 Atmosphere
- K.E.3 2.E.2 6.E.2 H.E.5 Weather

### Essential Knowledge

It is essential for students to know that Earth's atmosphere is the layer of gases that surrounds the planet and makes conditions on Earth suitable for living things.

<p>Atmospheric Layers</p>	<p>Earth's atmosphere is divided into several different atmospheric layers extending from Earth's surface outward</p> <ul style="list-style-type: none"> <li>• the <i>troposphere</i>, where all weather occurs</li> <li>• the <i>stratosphere</i>, where the ozone layer is contained</li> <li>• the mesosphere</li> <li>• the thermosphere</li> <li>• the exosphere</li> </ul>	<p>Earth's Surface</p>  <p>Space</p>
<p>Atmospheric Gases</p>	<p>Nitrogen and Oxygen</p> <ul style="list-style-type: none"> <li>• the two most common gases; found throughout all the layers</li> </ul> <p>Ozone</p> <ul style="list-style-type: none"> <li>• a form of oxygen found in the stratosphere</li> </ul> <p>Water vapor and Carbon dioxide</p> <ul style="list-style-type: none"> <li>• important gases for weather conditions; found in the troposphere</li> </ul> <p>Trace gases, for example argon</p> <ul style="list-style-type: none"> <li>• play an insignificant role</li> </ul>	
<p>Atmospheric Temperatures</p>	<p>Differences in temperature separate the layers</p> <ul style="list-style-type: none"> <li>• As altitude increases, temperature decreases in the troposphere</li> <li>• The stratosphere is cold except in its upper region where ozone is located</li> <li>• The mesosphere is the coldest layer</li> <li>• Even though the air is thin in the thermosphere, it is very hot</li> <li>• The cold regions of outer space extend from the exosphere</li> </ul>	

Atmospheric Pressure	<p>The air pressure, the force exerted by the gases pushing on an object, is greatest near the surface of Earth, in the troposphere.</p> <ul style="list-style-type: none"> <li>• Air pressure decreases through the layers farther out from the surface as Earth's pull of gravity decreases.</li> </ul>	<p>Troposphere pressure decreases Exosphere</p>

**Extended Knowledge**

- Know the exact distance between each layer or the temperature of the layers.
- The chemistry of the different gas particles (such as H<sub>2</sub> is an element, and CO<sub>2</sub> is a compound)
- Compare the properties of pure air with air containing particulate matter and unnatural gases, polluted air.

**Science and Engineering Practices**

S.1.A.8

**Standard**

**4.E.2:** The student will demonstrate an understanding of the water cycle and weather and climate patterns.

**Conceptual Understanding**

**4.E.2A.** Earth's atmosphere is a mixture of gases, including water vapor and oxygen. The movement of water, which is found almost everywhere on Earth including the atmosphere, changes form and cycles between Earth's surface and the air and back again. This cycling of water is driven by energy from the Sun. The movement of water in the water cycle is a major pattern that influences weather conditions. Clouds form during this cycle and various types of precipitation result.

**Performance Indicator**

**4.E.2A.2** Develop and use models to explain how water changes as it moves between the atmosphere and Earth's surface during each phase of the water cycle (including evaporation, condensation, precipitation, and runoff).

**Assessment Guidance**

The objective of this indicator is to *develop and use models* to explain how water changes as it moves between the atmosphere and Earth's surface during each phase of the water cycle. Therefore, the primary focus of assessment should be for students to construct 2-D drawings/diagrams and 3-D *models* or use simulations to investigate how water changes form and cycles between Earth's surface and the air, and back again. This could include but is not limited to students developing an illustration or model of the water cycle, and use this model or illustration to explain what happens to water as it moves through each phase of the water cycle.

*In addition to developing and using models, students should ask questions; plan and carryout investigations; analyze and interpret data; use mathematical and computational thinking; engage in scientific argument from evidence; construct explanations; obtain, evaluate, and communicate information; construct devices or design solutions.*

**Previous and Future Knowledge**

- 1.E.4, 2.E.2, 5.E.3, 6.E.2, H.E.5, H.E.6 Water cycle
- 6.E.2, H.E.4, H.E.5 Atmosphere
- 1.E.4, 3.E.4, 5.E.3, H.E.6 Earth's Surface

**Essential Knowledge**

It is essential for students to know that water changes form and cycles between Earth's surface and the air and back again. The components of the water cycle process include:

**Evaporation**

- Liquid water on Earth becomes a gas, called water vapor, as part of the air through the process of evaporation.
- The process of evaporation results from the Sun's energy.

**Condensation**

- Condensation happens in the air as water vapor changes back to droplets of water. Clouds form as a result of condensation; dew also forms from condensation, but the water droplets condense directly onto a surface such as grass, a car, or glass.
- The process of condensation results from the cooling of air temperature.

**Precipitation**

- After condensation occurs allowing for the forming of clouds, any form of water that falls from the clouds is called precipitation (rain, snow, sleet, hail).
- Snow, sleet, and hail result from freezing temperatures in the air; rain forms when the air temperature is above freezing.

**Runoff**

- If precipitation falls on land surfaces, it attempts to return to the ocean or lakes as runoff.

**Extended Knowledge**

- The process of transpiration from plants
- The movement of water through the groundwater system.

**Science and Engineering Practices**

S.1.A.2

**Standard**

**4.E.2:** The student will demonstrate an understanding of the water cycle and weather and climate patterns.

**Conceptual Understanding**

**4.E.2B.** Scientists record patterns in weather conditions across time and place to make predictions about what kind of weather might occur next. Climate describes the range of an area's typical weather conditions and the extent to which those conditions vary over long periods of time. Some weather conditions lead to severe weather phenomena that have different effects and safety concerns.

**Performance Indicator**

**4.E.2B.1** Analyze and interpret data from observations, measurements, and weather maps to describe patterns in local weather conditions (including temperature, precipitation, wind speed/direction, relative humidity, and cloud types) and predict changes in weather over time.

**Assessment Guidance**

The objective of this indicator is to *analyze and interpret data* from observations, measurements, and weather maps to describe and predict changes in weather. Therefore, the primary focus of assessment should be for students to *analyze and interpret data* from informational texts, observations, measurements, and weather maps to reveal patterns and construct meanings from analyzing weather data, which will lead to predicting changes in weather over time. This could include, but is not limited to students creating a weather journal by making observations and taking measurements of temperature, precipitation, wind speed/direction, humidity, and cloud types. With their weather journal they will then analyze the data and then be able to predict what changes will happen over time.

In addition to *analyzing and interpreting data*, students should *ask questions; develop and use models; plan and carryout investigations; use mathematical and computational thinking; engage in scientific argument from evidence; construct explanations; obtain, evaluate, and communicate information; construct devices or design solutions.*

**Previous and Future Knowledge**

- 2.E.2, 6.E.2, H.E.4, H.E.5 Weather – conditions and patterns

### Essential Knowledge

It is essential for students to carry out procedures for collecting and measuring weather conditions in order to understand daily weather conditions. Weather data must be collected and read accurately using appropriate instruments:

#### *Wind Speed*

- Wind speed is measured with an *anemometer* as the wind causes the cups to spin.
- As the cups spin, the anemometer counts how many times they spin in a given period of time.
- The more turns, the faster the wind speed.

#### *Wind Direction*

- Wind direction is determined with a *weather vane*.
- Wind direction is described by the direction from which the wind is blowing.

#### *Precipitation*

- Amount of precipitation is measured in a *rain gauge*.
- Markings on the side show how much rain has fallen.
- A rain gauge measures rainfall in inches.

#### *Temperature*

- Air temperature is measured using a *thermometer*.
- The scale may be read in degrees Fahrenheit or Celsius.

It is essential for students to know that using data collected through daily or long term observations and measurements, and patterns in weather can be seen. Weather predictions are based on qualitative and quantitative collected data; they are not just guesses.

- Some weather signs can be seen by looking at clouds.
- Changes in wind speed or wind direction can indicate storms or temperature changes.
- Meteorologists interpret information from a variety of sources and use those sources to make predictions. The information they use is shown on a weather map.
- Weather maps may show large masses of warm or cold moving air. Lines between the air masses are called *fronts*.
  - When a *warm front* passes over an area, the air temperature increases.
  - When a *cold front* passes over an area, the air temperature decreases.
- Data related to temperature and precipitation can also be found on a weather map.

### Extended Knowledge

- Students can make or use any of these instruments: sling psychrometer, barometer, or hygrometer.
- Know how to read weather map data related to air pressure, how fronts form, how the air masses move in each type of front, stationary or occluded fronts, how to interpret station models, or how to track a hurricane from data.

### Science and Engineering Practices

S.1.A.4

**Standard**

**4.E.2:** The student will demonstrate an understanding of the water cycle and weather and climate patterns.

**Conceptual Understanding**

**4.E.2B.** Scientists record patterns in weather conditions across time and place to make predictions about what kind of weather might occur next. Climate describes the range of an area's typical weather conditions and the extent to which those conditions vary over long periods of time. Some weather conditions lead to severe weather phenomena that have different effects and safety concerns.

**Performance Indicator**

**4.E.2B.2** Obtain and communicate information about severe weather phenomena (including thunderstorms, hurricanes, and tornadoes) to explain steps humans can take to reduce the impact of severe weather phenomena.

**Assessment Guidance**

The objective of this indicator is to *obtain and communicate information* about severe weather so humans can take steps to reduce the impact of the phenomena. Therefore, the primary focus of the assessment should be for students *to obtain information* from texts, observations, and discussions to *generate and answer questions*, and understand the phenomenon knowing that the weather conditions associated with severe weather are different for each type of storm. These conditions have different effects and there are safety concerns associated with each condition. This could include, but is not limited to students creating a digital publication of the safety measures related to each type of severe weather.

In addition to *obtaining and communicating information*, students should *ask questions; develop and use models; plan and carryout investigations; analyze and interpret data; use mathematical and computational thinking; engage in scientific argument from evidence; construct explanations; construct devices or design solutions.*

**Previous/Future Knowledge**

- 2.E.2, 6.E.2, H.E.5 Severe weather, including safety precautions
- 6.E.2, H.E.5 Pressure systems

### **Essential Knowledge**

It is essential for students to know that the weather conditions associated with severe weather are different for each type of storm. These conditions have different effects and there are safety concerns associated with each condition. Three types of severe weather include:

#### *Thunderstorm*

- A severe storm with lightning, thunder, heavy rain and strong winds.
- Hail may also form. Some examples of the effects of thunderstorms may be: heavy rains can cause flooding; lightning can cause fires; strong winds can blow over trees or power lines.

#### *Tornado*

- A small, funnel-shaped cloud that comes down from a storm cloud with winds spinning at very high speeds.
- Some examples of the effects of tornadoes may be: high winds can tear apart buildings, furthermore, destroying everything in its path.

#### *Hurricane*

- A large storm that forms over warm ocean water with very strong winds that blow in a circular pattern around the center, or eye, of the storm.
- Some examples of the effects of hurricanes may be: high winds can blow over trees, power lines, and even buildings; heavy rain can cause flooding; the storm waves on the ocean can come in at the beach and damage the coastal area

There are safety concerns related to these storms because of their conditions and effects. Some examples of these safety concerns may be:

- During a thunderstorm, stay inside if possible; stay out of the water; and do not stand under trees.
- During a tornado, find a safe place away from window; if you cannot find shelter lie flat in a ditch or other low place; and do not stay in your car.
- During a hurricane, board up windows in your house; stay away from windows; and move further inland if you are near the coast.

### **Extended Knowledge**

- Know how the storms form

### **Science and Engineering Practices**

S.1.A.8

**Standard**

**4.E.2:** The student will demonstrate an understanding of the water cycle and weather and climate patterns.

**Conceptual Understanding**

**4.E.2B.** Scientists record patterns in weather conditions across time and place to make predictions about what kind of weather might occur next. Climate describes the range of an area's typical weather conditions and the extent to which those conditions vary over long periods of time. Some weather conditions lead to severe weather phenomena that have different effects and safety concerns.

**Performance Indicator**

**4.E.2B.3** Construct explanations about regional climate differences using data from the long term weather conditions of the region.

**Assessment Guidance**

The objective of this indicator is to *construct explanations* about regional climate differences using data from the long term weather conditions of the region. Therefore, the primary focus of assessment should be *constructing explanations* using evidence of weather conditions and patterns to make predictions based on weather data collected from scientific models or graphs, tables, and diagrams. This could include, but is not limited to students proposing an explanation to regional climate differences and supporting the claim using weather maps and data collection from satellite and radar images.

In addition to *constructing explanations*, students should *ask questions; develop and use models; plan and carryout investigations; analyze and interpret data; use mathematical and computational thinking; engage in scientific argument from evidence; obtain, evaluate, and communicate information; construct devices or design solutions.*

**Previous/Future Knowledge**

- K.E.3, 2.E.2, 6.E.2, H.E.5 Weather patterns and climate

### **Essential Knowledge**

It is essential for students to know weather conditions and patterns can be predicted based on weather data collected from various sources.

#### *Direct Observations and Measurements*

- Basic weather conditions can be observed and/or measured using instruments or obtained from meteorologists at national weather data collection sites.
- In order to make weather predictions, the data should be collected on a regular basis over a period of time.
- This allows for the development of patterns in weather conditions from the analysis of the data.
- For example, a hurricane's path can be predicted using data on its position over time (plotted on a hurricane tracking map), thereby allowing meteorologists to make predictions concerning the possible warnings to land areas in the hurricane's path.

#### *Weather maps*

- Weather maps can help predict weather patterns by indicating high or low pressure systems (isobars), movement of air masses and fronts, or temperature ranges (isotherms).
- Station models from specific locations provide information that can also be used to predict weather patterns.
- Information found on a station model can include cloud cover, temperature (85°F), wind direction and speed, precipitation (\* - snow, ● – rain), or barometric pressure (1,002 mb).

#### *Satellites*

- Satellite images are used for seeing cloud patterns and movements.
- For example, hurricane clouds and movement can be observed using satellite images.

#### *Radar*

- Radar images can be used to detect cloud cover, rainfall or storm location, intensity, and movement, as well as the potential for severe weather (for example, hurricanes or tornadoes).

### **Extended Knowledge**

- Know how to draw weather maps or isobar or isotherm lines.
- Identify other information found on a station model such as the types of clouds, dew point, types of precipitation (other than snow or rain), or change in barometric pressure.

### **Science and Engineering Practices**

S.1.A.6

**Standard**

**4.E.3:** The student will demonstrate an understanding of the locations, movements, and patterns of stars and objects in the solar system.

**Conceptual Understanding**

**4.E.3A.** Astronomy is the study of objects in our solar system and beyond. A solar system includes a sun, (star), and all other objects that orbit that sun. Planets in our night sky change positions and are not always visible from Earth as they orbit our Sun. Stars that are beyond the solar system can be seen in the night sky in patterns called constellations. Constellations can be used for navigation and appear to move together across the sky because of Earth’s rotation.

**Performance Indicator**

**4.E.3A.1** Develop and use models of Earth’s solar system to exemplify the location and order of the planets as they orbit the Sun and the main composition (rock or gas) of the planets.

**Assessment Guidance**

The objective of this indicator is to *develop and use models* to explain the location and order of Earth’s solar system, and the main composition of the planets. Therefore, the primary focus of assessment should be for students to develop and use models to understand phenomena, processes, and relationships; test devices or solutions, or communicate ideas to others. This could include, but is not limited to students constructing 2-D drawings/diagrams and 3-D models that represent and explain the properties of the Earth, Moon, and Sun, the composition of the inner and outer planets, as well as the order of the planets as they orbit the Sun. This could also include students developing a model to demonstrate the order of the planets from the Sun, as well as well illustrate the composition of the planets.

In addition to *developing and using models*, students should *ask questions; plan and carryout investigations; analyze and interpret data; use mathematical and computational thinking; engage in scientific argument from evidence; construct explanations; obtain, evaluate, and communicate information; construct devices or design solutions.*

**Previous/Future Knowledge**

- 1.E.3, 8.E.4, 8.E.6, H.E.2 Earth’s solar system

### **Essential Knowledge**

It is essential for students to know that Earth is a planet that orbits around the Sun. There are also other planets that orbit the Sun; some are closer to the Sun than Earth, and others are farther away. Some are small, rocky planets like Earth (Mercury, Venus, and Mars); some are large planets with a surface made of gas (Jupiter, Saturn, Neptune, and Uranus) unlike Earth.

*Planets* - Planets are bodies, natural satellites, that orbit the Sun, a star.

*Earth* - Earth is the third planet from the Sun in the solar system

*Sun* - The Sun is the name for the central star in our solar system.

The sequence of the named planets from the Sun outward is also part of this recall. It is also essential for students to know that even though the Sun, the Moon and Earth are all in the solar system, they have different properties.

*Earth*

- Earth has a rocky surface as a planet and also has water on it.
- It has an atmosphere of gases around it.
- It orbits millions of miles from the Sun as the third planet in the solar system.

*Sun*

- The Sun is a star, a large ball of glowing gases that is extremely hot.
- It does not have a rocky surface and its atmosphere glows and gives off light.
- It is located at the center of the solar system.
- Earth and other planets revolve around it.
- The sun is a star that appears brighter because it is closer to Earth than other stars.

*Moon*

- The Moon is the natural satellite that orbits the Earth.
- It has a rocky, dusty surface with many craters and no water.
- It has no atmosphere.

It is essential for students to know that the Sun is a star which produces heat and light deep down inside of it.

- The Sun produces and gives off heat and light.
- Earth receives that heat and light after they travel through space.
- The Sun is the source of almost all energy on Earth.
- Plants take the Sun's energy and use it to make food energy.
- The Sun's energy causes weather conditions on Earth.
- Heat from the Sun causes the process of evaporation of water on Earth's surface.
- The Sun's energy is stored in fossil fuels (for example, coal, oil, or natural gas) that formed from some organisms that died long ago.

### **Extended Knowledge**

- Know specific data about each planet, for example, distance from sun, time of revolution or rotation.
- Name the planets with rings; identify the names of or number of moons a planet has.

- Order the planets by any characteristic other than their orbiting arrangement as they revolve around the Sun.
- Know more specific data about Earth compared to the Sun and the Moon, for example, time of revolution or rotation with this indicator.
- Know the nuclear process that takes place so that the Sun can produce heat and light.
- Know the types of radiation that the Sun gives off.

**Science and Engineering Practices**

S.1.A.2

**Standard**

**4.E.3:** The student will demonstrate an understanding of the locations, movements, and patterns of stars and objects in the solar system.

**Conceptual Understanding**

**4.E.3A.** Astronomy is the study of objects in our solar system and beyond. A solar system includes a sun, (star), and all other objects that orbit that sun. Planets in our night sky change positions and are not always visible from Earth as they orbit our Sun. Stars that are beyond the solar system can be seen in the night sky in patterns called constellations. Constellations can be used for navigation and appear to move together across the sky because of Earth's rotation.

**Performance Indicator**

**4.E.3A.2** Obtain and communicate information to describe how constellations (including Ursa Major, Ursa Minor, and Orion) appear to move from Earth's perspective throughout the seasons.

**Assessment Guidance**

The objective of this indicator is to *obtain and communicate information* to describe how constellations appear to move from Earth's perspective throughout the seasons. Therefore, the primary focus of assessment should be for students to evaluate informational texts, observations, and data collected about the constellations' apparent motion and then use this information to understand the phenomena and support their explanations. This could include but is not limited to students creating an observation journal describing where the North Star is and then it's relation to the major constellations listed. Students can then use this to support their understanding and explanation of apparent motion phenomena.

In addition to *obtaining and communicating information*, students should *ask questions; develop and use models; plan and carryout investigations; analyze and interpret data; use mathematical and computational thinking; engage in scientific argument from evidence; construct explanations; construct devices or design solutions.*

**Previous/Future Knowledge**

- 1.E.3 8.E.4 H.E.2 shapes and compositions of galaxies

**Essential Knowledge**

Describe the appearance and apparent motion of groups of stars in the night sky relative to Earth, and how various cultures have understood and used them.

- Locate and identify stars that are grouped in patterns in the night sky.
- Identify ways people have historically grouped stars in the night sky.
- Relate the seasonal change in the appearance of the night sky to Earth's position.
- Describe ways that familiar groups of stars may be used for navigation and calendars.

**Extended Knowledge**

- Model the position of the Sun in the universe, the shapes and composition of galaxies, and the measurement unit needed to identify star and galaxy locations.
- Construct explanations for how gravity and motion affect the formation and shapes of

galaxies (including the Milky Way Galaxy)

**Science and Engineering Practices**  
S.1.A.8

Working draft

**Standard**

**4.E.3:** The student will demonstrate an understanding of the locations, movements, and patterns of stars and objects in the solar system.

**Conceptual Understanding**

**4.E.3A.** Astronomy is the study of objects in our solar system and beyond. A solar system includes a sun, (star), and all other objects that orbit that sun. Planets in our night sky change positions and are not always visible from Earth as they orbit our Sun. Stars that are beyond the solar system can be seen in the night sky in patterns called constellations. Constellations can be used for navigation and appear to move together across the sky because of Earth's rotation.

**Performance Indicator**

**4.E.3A.3** Construct scientific arguments to support claims about the importance of astronomy in navigation and exploration (including the use of telescopes, astrolabes, compasses, and sextants).

**Assessment Guidance**

The objective of this indicator is to *construct scientific arguments to support claims* about the importance of astronomy in navigation and exploration. Therefore, the primary focus of assessment should be for students to *construct explanations* using scientific evidence and models and data communicated in graphs, tables, and diagrams about telescopes, astrolabes, compasses, and sextants and how they aid in the navigation and exploration of space. This could include, but is not limited to students researching the tools and technology and connect their findings to support how they are important to the navigation and exploration in astronomy.

**Previous/Future Knowledge**

- 8.E.4 H.E.2 Telescopes, satellites, space probes, spectroscopes
- 1.E.3 8.E.4 H.E.2 Astronomy

**Essential Knowledge**

It is essential for students to know that telescopes, astrolabes, compasses, and sextants are tools that aid in the study of objects in outer space.

A **Telescope** can gather more light than the eye, so it makes faint, faraway objects seem brighter and closer.

An **astrolabe** is a compact instrument used to observe and calculate the position of celestial bodies before the invention of the sextant.

A **compass** is a navigational instrument that shows directions in a frame of reference that is stationary relative to the surface of the Earth. The frame of reference defines the four *cardinal directions* (or *points*) – north, south, east, and west. Intermediate directions are also defined. Usually, a diagram called a compass rose, which shows the directions (with their names usually abbreviated to initials), is marked on the compass. When the compass is in use, the rose is aligned with the real directions in the frame of reference, so, for example, the

"N" mark on the rose really points to the north.

A **sextant** is an instrument used to measure the angle between any two visible objects. Its primary use is to determine the angle between a celestial object and the horizon which is known as the object's *altitude*. Using this measurement is known as *sighting* the object, *shooting* the object, or *taking a sight*, and it is an essential part of celestial navigation. The angle, and the time when it was measured can be used to calculate a position line on a nautical or aeronautical chart. Common uses of the sextant include sighting the sun at solar noon and sighting Polaris at night (in the Northern Hemisphere), to find one's latitude.

**Extended Knowledge**

- Know about the design of reflecting and refracting telescopes
- Construct or experience the use of a telescope.

**Science and Engineering Practices**

S.1.A.6

**Standard**

**4.E.3:** The student will demonstrate an understanding of the locations, movements, and patterns of stars and objects in the solar system.

**Conceptual Understanding**

**4.E.3B.** Earth orbits around the Sun and the Moon orbits around Earth. These movements together with the rotation of Earth on a tilted axis result in patterns that can be observed and predicted.

**Performance Indicator**

**4.E.3B.1** Analyze and interpret data from observations to describe patterns in the (1) location, (2) movement, and (3) appearance of the Moon throughout the year.

**Assessment Guidance**

The objective of this indicator is to *analyze and interpret data* from observations of the appearance, movement, and location of the Moon. Therefore, the primary focus of assessment should be for students to analyze and interpret data from observations to construct meaning and support explanations in the understanding that the Moon appears to change shape, which we call phases and that the Moon and Earth's gravitational pull on each other cause tides on Earth's oceans. This could include, but is not limited to students developing a Moon observation calendar that they use to construct the meaning of the Moon's phases based on the location of the Moon in regards to the Earth and Sun.

In addition to *analyzing and interpreting data*, students should *ask questions; develop and use models; plan and carryout investigations; use mathematical and computational thinking; engage in scientific argument from evidence; construct explanations; obtain, evaluate, and communicate information; construct devices or design solutions.*

**Previous and Future Knowledge**

- 1.E.3, 3.E.4, 8.E.4, H.E.2 Moon characteristics and properties
- 1.E.3, 3.E.4, 8.E.4, H.E.2 Effects of motion

### Essential Knowledge

It is essential for students to know that the Moon reflects light from the Sun and just like Earth, half of the Moon is always lit by the Sun.

- Because of the positions of the Sun, the Moon, and Earth, the Moon appears to change shape.
- The amount of reflected light from the Moon that is seen from Earth determines the phase.

The changing shapes of the Moon are called *phases*. There are four main phases:

*New moon* – the entire half/side of the Moon facing Earth is dark.

*Quarter moon* – half of the side of the Moon facing Earth is lighted and the other half is dark; the Moon appears as a half circle; there are two quarter moon phases in the cycle.

NOTE TO TEACHER: Students may see the name also as Half moon.

*Full moon* – the entire half/side of the Moon facing Earth is lighted; the Moon appears as a full circle.

*Crescent moon* – a small section (less than a quarter moon) of the half/side of the Moon facing Earth is lighted.

The change in the Moon's phases from new moon to new moon takes about four weeks, 29½ days.

It is essential for students to know that the Moon and Earth pull on each other because of gravity.

- The Moon's pull on Earth makes the surface level of the ocean rise and fall. This change in level is called *tide*
- High tide is when the ocean water level is the highest; there are two high tides each day.
- Low tides occur between high tides.

### Extended Knowledge

- Eclipses of the Moon

### Science and Engineering Practices

S.1.A.4

**Standard**

**4.E.3:** The student will demonstrate an understanding of the locations, movements, and patterns of stars and objects in the solar system.

**Conceptual Understanding**

**4.E.3B.** Earth orbits around the Sun and the Moon orbits around Earth. These movements together with the rotation of Earth on a tilted axis result in patterns that can be observed and predicted.

**Performance Indicator**

**4.E.3B.2** Construct explanations of how day and night result from Earth's rotation on its axis.

**Assessment Guidance**

The objective of this indicator is to *construct explanations* of how day and night result from Earth's rotation on its axis. Therefore, the primary focus of assessment should be for students to use scientific evidence and models to construct an explanation of how Earth's rotation from west to east makes the Sun appear to rise in the east and set in the west, day resulting from the side of Earth facing the Sun, and night resulting from the of side of Earth not facing the Sun. This could include, but is not limited to students using a model to explain why the Sun appears to rise in the east and set in the west causing day and night on Earth.

In addition to *constructing explanations*, students should *ask questions; develop and use models; plan and carryout investigations; analyze and interpret data; use mathematical and computational thinking; engage in scientific argument from evidence; obtain, evaluate, and communicate information; construct devices or design solutions.*

**Previous/Future Knowledge**

- 1.E.3, 8.E.4, H.E.2 Solar System
- 1.E.3, 2.E.2, 8.E.4, H.E.5 Sunlight, effects of motion, length of day/year

**Essential Knowledge**

It is essential for students to know that:

- Earth *rotates* (spins) on its axis and completes one rotation in 24 hours.
- Earth rotates from west to east, therefore, the Sun appears to rise in the east and set in the west.
- Because of this rotation, only the side of Earth facing the Sun is lit and therefore experiences day; the side of Earth not facing the Sun experiences night.

**Extended Knowledge**

- Rotation of other planets.

**Science and Engineering Practices**

S.1.A.6

**Standard**

**4.E.3:** The student will demonstrate an understanding of the locations, movements, and patterns of stars and objects in the solar system.

**Conceptual Understanding**

**4.E.3B.** Earth orbits around the Sun and the Moon orbits around Earth. These movements together with the rotation of Earth on a tilted axis result in patterns that can be observed and predicted.

**Performance Indicator**

**4.E.3B.3** Construct explanations of how the Sun appears to move throughout the day using observations of shadows.

**Assessment Guidance**

The objective of this indicator is to *construct explanations* of how the Sun appears to move throughout the day based on shadows. Therefore, the primary focus of assessment should be for students to construct an explanation using scientific evidence and models, and conclusions from scientific investigations that describes how shadows help show Earth’s rotation based on the position and angle of the Sun. This could include, but is not limited to students using the Sun’s position and their shadow’s position throughout the day and explain why the shadow moves as the Sun rises and sets.

In addition to *constructing explanations*, students should *ask questions; develop and use models; plan and carryout investigations; analyze and interpret data; use mathematical and computational thinking; engage in scientific argument from evidence; obtain, evaluate, and communicate information; construct devices or design solutions.*

**Previous/Future Knowledge**

- K.E.3, 1.E.3, 2.E.2, 8.E.4, H.E.2 The Sun, eclipses

**Essential Knowledge**

It is essential for students to know that objects on Earth cast shadows that help show Earth’s rotation. The angle of the Sun, low in the sky to higher in the sky, changes the length of the shadow cast behind an object.

- In the morning, the Sun appears low in the sky, so objects cast long shadows.
- As Earth rotates, the Sun’s appears higher in the sky, and the shadows get shorter.
- At noon, with the Sun overhead, objects cast short shadows or no shadow at all.
- As Earth continues to rotate, and the Sun appears lower in the sky toward evening, the shadows get longer again.

**Extended Knowledge**

- Types of shadows cast, umbra, or penumbra.
- Make or interpret sundials.

**Science and Engineering Practices**

S.1.A.6

**Standard**

**4.E.3:** The student will demonstrate an understanding of the locations, movements, and patterns of stars and objects in the solar system.

**Conceptual Understanding**

**4.E.3B.** Earth orbits around the Sun and the Moon orbits around Earth. These movements together with the rotation of Earth on a tilted axis result in patterns that can be observed and predicted.

**Performance Indicator**

**4.E.3B.4** Develop and use models to describe the factors (including tilt, revolution, and angle of sunlight) that result in Earth's seasonal changes.

**Assessment Guidance**

The objective of this indicator is to *develop and use models* to describe the factors that result in Earth's seasonal changes. Therefore, the primary focus of assessment should be for students to construct 2-D drawings/diagrams and 3-D models that represent the phenomena of how the Earth's revolution and tilt create Earth's distinct seasons. This could include, but is not limited to students creating a model to illustrate Earth's seasons based on the Earth's tilt and revolution.

In addition to *developing and using models*, students should *ask questions; plan and carryout investigations; analyze and interpret data; use mathematical and computational thinking; engage in scientific argument from evidence; construct explanations; obtain, evaluate, and communicate information; construct devices or design solutions.*

**Previous/Future Knowledge**

- K.E.3, 1.E.3, 8.E.4 Seasonal patterns
- K.E.3, 1.E.3, 2.E.2, 8.E.4, H.E.2, H.E.5 Sunlight, tilt of Earth's axis

### **Essential Knowledge**

It is essential for students to know that Earth has distinct seasons which result from the tilt of its axis and its revolution around the Sun.

- Earth revolves around the Sun one time each year in about 365 days.
- Earth has seasons because Earth's axis is tilted.
- Because of the tilt, the number of daylight hours changes throughout the year.
- As Earth revolves around the Sun, different parts of Earth get more sunlight.
- The tilt also causes the northern or the southern part of Earth, to point toward the Sun.
- When the tilt is toward the Sun, the season is summer; when the tilt is away from the Sun, the season is winter.
- The two hemispheres have opposite seasons.
- The seasons do NOT depend on the distance of Earth from the Sun.

#### *Axis*

Earth rotates around an imaginary straight line called an axis that runs through the planet's center.

#### *Revolution*

The movement of Earth as it makes an orbit around the Sun in one year.

#### *Seasons*

The effects on Earth due to the change in the amount of sunlight caused by the tilt of Earth's axis.

Summer occurs when part of Earth is tilted most toward the Sun

Autumn, or spring occur when neither part of Earth is pointed directly toward or away from the Sun.

Winter occurs when part of Earth is tilted away from the Sun.

The sequence of the seasons during the year is summer, autumn/fall, winter, and then spring.

### **Extended Knowledge**

- Angle of the Sun's rays

### **Science and Engineering Practices**

S.1.A.2

**Standard**

**4.P.4:** The student will demonstrate an understanding of the properties of light and sound as forms of energy.

**Conceptual Understanding:**

**4.P.4A** Light, as a form of energy, has specific properties including color and brightness. Light travels in a straight line until it strikes an object. The way light reacts when it strikes an object depends on the object's properties.

**Performance Indicator**

**4.P.4A.1** Construct scientific arguments to support the claim that white light is made up of different colors.

**Assessment Guidance**

The objective of this indicator is to *construct scientific arguments* to support the claim that white light is made up of different colors. Therefore, the primary focus of assessment should be for students to *construct scientific arguments to support claims, explanations, or designs using evidence from observations, data, or informational texts* to explain that white light can be separated into energy of many colors (visible spectrum) by a prism. This could include, but is not limited to students conducting investigations in which they use the prism tool to separate white light into the visible spectrum. Students use the data from their observations to support the claim that white light is made up of different colors.

In addition to constructing scientific arguments, students should *ask questions; develop and use models; plan and carryout investigations; analyze and interpret data; use mathematical and computational thinking; obtain, evaluate, and communicate information; construct devices or design solutions.*

**Previous and Future Knowledge**

- 1.P.2 Light
- 8.P.3A.1 Energy

**Essential Knowledge**

It is essential for students to construct scientific arguments explaining that light is a form of energy and is made of many colors.

*Energy*

- *Energy* is the ability to make something move, happen, or change.

*Colors*

- Light, or “white light”, is made up of all colors of light mixed together.
- If white light is passed through a *prism*, it can be separated into light of different *colors*.
- The colors are red, orange, yellow, green, blue, indigo and violet.
- These are the colors seen in a rainbow
- The different colors of light revealed when white light is passed through a prism are called the *spectrum*.
- These colors are related to the different amounts of energy in white light.

\*SCIENTIFIC TOOLS used to construct scientific arguments that support the claim provide evidence that white light is made up of different colors (prism, flashlight)

**Extended Knowledge**

- Light energy moves in waves
- Each color of the rainbow has a different wavelength
- Astronomers spread starlight into a spectrum to study the specific colors of light

NOTE: The sun makes rainbows when white sunlight passes through rain drops

**Science and Engineering Practices**

Working draft

**Standard**

**4.P.4:** The student will demonstrate an understanding of the properties of light and sound as forms of energy.

**Conceptual Understanding:**

**4.P.4A :** Light, as a form of energy, has specific properties including color and brightness. Light travels in a straight line until it strikes an object. The way light reacts when it strikes an object depends on the object's properties.

**Performance Indicator**

**4.P.4A.4** Develop and use model to describe how light travels and interacts when it strikes an object (including reflection, refraction, and absorption) using evidence from observations.

**Assessment Guidance**

The objective of this indicator is to *develop and use a model* to describe how light travels and interacts when it strikes an object (including reflection, refraction, and absorption). Therefore, the primary focus of assessment should be for students to *understand or represent phenomena, processes, and relationships; test devices or solutions, or communicate ideas to others* that light travels in a straight line until it strikes objects, then reflects, refracts or absorbs. This could include, but is not limited to students constructing 3D models and simulations to investigate the phenomena of reflection, refraction and absorption, and then using observations as evidence to explain each phenomenon.

In addition to developing and using a model, students should *ask questions; plan and carryout investigations; analyze and interpret data; use mathematical and computational thinking; engage in scientific argument from evidence; construct explanations; obtain, evaluate, and communicate information; construct devices or design solutions.*

**Previous and Future Knowledge**

- 1.P.2 Light
- 8.P.3A.3 Refraction, reflection, absorption
- 8.P.3A.5 Color filters

**Essential Knowledge**

It is essential for students to *develop and use models* demonstrating that light travels in a straight line away from the light source. It can travel through transparent material and empty space. The way that light reacts when it strikes an object varies with the object.

*Reflection*

- When light is *reflected*, it bounces back from a surface.
- Reflection allows objects to be seen that do not produce their own light.
- When light strikes a smooth, shiny object, it is reflected so that an image can be seen. For example, a mirror or a pool of water will reflect (bounce back) an image very similar to the object.

*Refraction*

- When light is refracted it passes from one type of transparent material to another, and changes direction. For example, when light travels through a magnifying glass, it changes direction, and we see a larger, magnified view of the object.
- When a straw is viewed in water, light passes from the water to the air causing the path of the light to bend. When the light bends, the straw appears distorted (bent or broken)

### *Absorption*

- When light is *absorbed* it does not pass through or reflect from a material. It remains in the material as another form of energy.

### *Seeing Color*

- The colors of objects are determined by the light that is not *absorbed* but is *reflected* by the objects.
- The color of the light that is reflected from an object is the color that the object appears. For example, a red object reflects red colors of light and absorbs all other colors.
- The color black is seen when all of the colors of light are absorbed.
- The color white is seen when all of the colors of light are reflected.

\*SCIENTIFIC TOOLS used to create models to describe how light travels and interacts when it strikes an object (mirror, magnifier, prism, flashlight)

### **Extended Knowledge**

- Absorbed light turns into heat energy
- The angles of reflection and refraction are different from each other
- Pigments of light mix to form various colors

### **Science and Engineering Practices**

S.1.A.2

**Standard**

**4.P.4:** The student will demonstrate an understanding of the properties of light and sound as forms of energy.

**Conceptual Understanding:**

**4.P.4A** Light, as a form of energy, has specific properties including color and brightness. Light travels in a straight line until it strikes an object. The way light reacts when it strikes an object depends on the object's properties.

**Performance Indicator**

**4.P.4A.5** Plan and conduct scientific investigations to explain how light behaves when it strikes transparent, translucent, and opaque materials.

**Assessment Guidance**

The objective of this indicator is to *plan and conduct scientific investigations* to explain how light behaves when it strikes transparent, translucent, and opaque materials. Therefore, the primary focus of assessment should be for students *to plan and conduct scientific investigations to answer questions, test predictions, and develop explanations. Students should formulate scientific questions and predict possible outcomes, identify materials, procedures, and variables; select and use appropriate tools or instruments to collect qualitative and quantitative data, and record and represent data in an appropriate form* in order to explain how light behaves when it strikes different materials. Based on prior knowledge and student generated questions, students use provided materials to plan and conduct investigations that test how light behaves when it strikes transparent, translucent, and opaque materials. Qualitative data is recorded and organized in the appropriate format and used to answer questions, test predictions and develop explanations.

In addition to planning and conducting scientific investigations, students should *ask questions; develop and use models; analyze and interpret data; use mathematical and computational thinking; engage in scientific argument from evidence; construct explanations; obtain, evaluate, and communicate information; construct devices or design solutions.*

**Previous and Future Knowledge**

- Light (1.P.2)

**Essential Knowledge**

It is essential for students to *plan and conduct scientific investigations* that explain how light behaves differently when it strikes different types of materials.

*Transparent*

- A *transparent* material allows light to pass through it.
- Objects can be seen clearly when viewed through transparent materials.
- Air, glass, and water are examples of materials that are *transparent*.

*Translucent*

- A *translucent* material allows some of the light to pass through it.
- Objects either scatters or absorbs light that strikes it.
- Objects appear as blurry shapes when viewed through translucent materials.
- Waxed paper and frosted glass are examples of materials that are *translucent*.

*Opaque*

- An *opaque* material does not allow light to pass through. Light is either reflected from or absorbed by an opaque material.
- Opaque objects block light, and cast a shadow.
- Wood, metals, and thick paper are examples of materials that are *opaque*.

\*SCIENTIFIC TOOLS used to create investigate how light behaves when it strikes transparent, translucent, and opaque materials (glass beaker, plastic beaker, flashlight, prism, or any other appropriate materials)

#### **Extended Knowledge**

- The interaction of light waves with different materials makes them transparent, translucent, or opaque.

#### **Science and Engineering Practices**

S.1.A.3

**Standard**

**4.P.4:** The student will demonstrate an understanding of the properties of light and sound as forms of energy.

**Conceptual Understanding**

**4.P.4B** Sound, as a form of energy, is produced by vibrating objects and has specific properties including pitch and volume. Sound travels through air and other materials and is used to communicate information in various form of technology.

**Performance Indicator**

**4.P.4B.1:** Plan and conduct scientific investigations to test how different variables affect the properties of sound (including pitch and volume).

**Assessment Guidance**

The objective of this indicator is to *plan and conduct scientific investigations* to test how different variables affect the properties of sound (including pitch and volume). Therefore, the primary focus of assessment should be for students to *plan and conduct scientific investigations to answer questions, test predictions, and develop explanations. Students should formulate scientific questions and predict possible outcomes, identify materials, procedures, and variables; select and use appropriate tools or instruments to collect qualitative and quantitative data, and record and represent data in an appropriate form* in order to test different variables of pitch and volume of sound. This could include but is not limited to students carrying out investigations to test sound devices or variables such as string length, thickness and tension to affect pitch.

In addition to planning and conducting scientific investigations, students should *ask questions; develop and use models; analyze and interpret data; use mathematical and computational thinking; engage in scientific argument from evidence; construct explanations; obtain, evaluate, and communicate information; construct devices or design solutions.*

**Previous and Future Knowledge**

- 8.P.3 Sound

**Essential Knowledge**

It is essential for students to plan and conduct scientific investigations that test sound vibrations that move through matter. These vibrations are back and forth movements that occur very quickly.

*Vibration*

- Vibrations can be transferred from one material to another causing that material to vibrate.
- Vibrations of materials causing sound can travel through solids, liquids, and gases, but they cannot travel through empty space where there are no particles of matter to vibrate.
- Sound moves better through some materials than others. For example, the sound of water filling a bath tub sounds louder under the water, moving through the liquid, than above the water, moving through the air.

Sound can have different pitches and volumes, as follows:

*Pitch*

- The *pitch* of a sound is how high or low it is.
- For example, an average dog growling produces a lower pitch than an average bird song, or a tuba can play lower pitches than a flute.
- There are several physical properties of the vibrating material that affect the resulting pitch

of the sound. Changing these properties will change the pitch the object produces when vibrating. These are a few such properties:

○ *Thickness:*

- A vibrating object with a *greater thickness* will produce a *lower pitch* than a vibrating object with a lesser thickness.
- For example, a thicker string will produce a lower pitch when plucked than the pitch a thinner string will produce.
- Thinner string or wires vibrate *faster* than thicker strings or wires.

○ *Length:*

- A vibrating object with a *greater length* will produce a *lower pitch* than a vibrating object with a lesser length.
- For example, a longer string will produce a lower pitch when plucked than the pitch a shorter string will produce.
- Shorter objects vibrate *faster* than longer objects.

○ *Tension:*

- Tension is the tightness of an object, for example, a tightly stretched rubber band or string.
- A vibrating object under *greater tension* will produce a *higher pitch* than a vibrating object under lesser tension.
- For example, stretching a rubber band as much as possible and plucking it will produce a higher pitch than if the rubber band is under less tension.
- Objects under greater tension vibrate faster than objects under less tension.

### Volume

- *Volume* is the loudness or softness of a sound.
- For example, the sound of a person yelling is a louder volume than the sound of a person whispering – even if the pitch remains the same.
- There are several physical properties of the vibrating material that affect the resulting volume of the sound. Changing these properties will change the volume the object produces when vibrating. These are a few such properties:

○ *Force:*

- Exerting a *larger force* on a vibrating object will produce a *louder volume* than exerting a lesser force.
- The strength of the force alters the strength of the vibrations.
- For example, tapping a desk lightly produces a soft sound while hitting a desk hard produces a loud sound.

○ *Distance:*

- If the sources of the sound are *farther away*, the volume of the sound is softer.
- The closer the source of the sound, the louder the volume of the sound will be.
- For example, a person sounds louder if you are sitting right next to them than if you are sitting across the room from them.

\*SCIENTIFIC TOOLS used to plan and conduct scientific investigations to test how different

variables affect the properties of sound (glass beaker, tuning fork, musical instruments)

**Extended Knowledge**

- Sound waves are mechanical waves with three commonly measured attributes: wavelength, amplitude, and frequency.
- Pitch is related to the frequency of the sound wave. The frequency of a sound wave is like the speed of the sound wave.
- Volume is related to the amplitude of the sound wave. The amplitude of a sound wave is the tallness of the sound wave.

**Science and Engineering Practices**

S.1.A.3

**Standard**

**4.P.4:** The student will demonstrate an understanding of the properties of light and sound as forms of energy.

**Conceptual Understanding**

**4.P.4B** Sound, as a form of energy, is produced by vibrating objects and has specific properties including pitch and volume. Sound travels through air and other materials and is used to communicate information in various form of technology.

**Performance Indicator**

**4. P.4B.2:** Analyze and interpret data from observations and measurements to describe how change in vibration affects the pitch and volume of sound.

**Assessment Guidance**

The objective of this indicator is to *analyze and interpret data* from observations and measurements to describe how change in vibration affects the pitch and volume of sound. Therefore, the primary focus of assessment should be for *students to analyze and interpret data from informational texts, observations, measurements, or investigations using a range of methods (such as tabulation or graphing) to reveal patterns and construct meaning, or support explanations, claims, or designs* that illustrate that changes in vibration alter the resulting pitch or volume of the sound in several different ways. This could include but is not limited to students collecting and recording data from a series of investigations involving pitch of sound. Students analyze and interpret the data in order to reveal a pattern of the thickness, length, and tension of vibrating object alters the pitch of sound.

In addition to analyzing and interpreting data, students should *ask questions; develop and use models; plan and carryout investigations; use mathematical and computational thinking; engage in scientific argument from evidence; construct explanations; obtain, evaluate, and communicate information; construct devices or design solutions.*

**Previous and Future Knowledge**

- Sound (8.P.3)

**Essential Knowledge**

It is essential for students to analyze and interpret data demonstrating how changes in vibration alter the resulting pitch or volume of the sound in several different ways:

**Pitch**

- The faster the vibration of the object, the higher the pitch of the sound; the slower the vibration of the object, the lower the pitch of the sound.
  - **Thickness:**
    - Thinner string or wires vibrate *faster* than thicker strings or wires, producing a *higher* pitch.
  - **Length:**
    - Shorter objects vibrate *faster* than longer objects, producing a *higher* pitch.
  - **Tension:**
    - Objects under greater tension vibrate faster than objects under less tension, producing a *higher* pitch.

**Volume**

- The larger the vibration of the object, the louder the volume of the sound. The smaller the

vibration of the object, the quieter the volume of the sound.

○ **Force:**

- A greater force will produce a *larger* vibration, which will produce a *louder* sound.

○ **Distance:**

- The closer the source of the vibration, the *larger* the vibration will be, so the sound will be *louder* at that location.

**\*SCIENTIFIC TOOLS** used to analyze and interpret data from observations and measurements to describe how change in vibration affects the pitch and volume of sound (**tuning fork, musical instruments**)

**Extended Knowledge**

- A sound wave with a greater frequency produces a higher pitch than a sound wave with a lesser frequency.
- A sound wave with larger amplitude produces a louder volume than a sound wave with smaller amplitude.
- The largeness or smallness of the wave – its amplitude – decreases as the wave travels over distances, in what is known as the Doppler Effect. This causes the volume of the sound wave to be different at different locations, even though it is the same sound wave.

**Science and Engineering Practices**

S1.A.4

**Standard**

**4.P.4:** The student will demonstrate an understanding of the properties of light and sound as forms of energy.

**Conceptual Understanding**

**4.P.4B** Sound, as a form of energy, is produced by vibrating objects and has specific properties including pitch and volume. Sound travels through air and other materials and is used to communicate information in various form of technology.

**Performance Indicator**

**4. P.4B.3:** Define problems related to the communication of information over a distance and design devices or solutions that use sound to solve the problem.

**Assessment Guidance**

The objective of this indicator is to *define problems* related to the communication of information over a distance and *design devices or solutions* that use sound to solve the problem. Therefore, the primary focus of assessment should be for students to *ask questions to identify problems or needs, ask questions about the criteria and constraints of the devices or solutions, generate and communicate ideas for possible devices or solutions, build and test devices or solutions, determine if the devices or solutions solved the problem, and describe results* related to using sound to solve problems for communicating information over distances. This could include but is not limited to students using prior knowledge acquired from investigations to define problems related to how volume and clarity of sound reduce over distance. They will then design and test devices to discover a solution for these problems.

In addition to defining problems to design devices or solutions, students should *ask questions; develop and use models; plan and carryout investigations; analyze and interpret data; use mathematical and computational thinking; engage in scientific argument from evidence; construct explanations; obtain, evaluate, and communicate information.*

**Previous and Future Knowledge**

- H.P.3B.3 Sound Energy

**Essential Knowledge**

It is essential for students to identify problems and needs related to communication of information over a distance and to design devices to solve the problems. Students should define problems related to the communication of information over a distance. Possible problems include but are not limited to:

- The volume and clarity of sound decreasing and ceasing over a distance.

Design devices or solutions that use sound to solve the problem - to make a sound audible across a distance at which the same sound would not originally have been heard.

Students are expected to engage in the engineering design process by asking questions, designing devices, investigating possible solutions and repeating trials to determine which devices best solve the problem.

\*SCIENTIFIC TOOLS used to describe how change in vibration affects the pitch and volume of sound (tuning fork, musical instruments)

**Extended Knowledge**

- Sound dissipates over a distance because amplitude decreases. Internal friction causes loss of clarity. Also caused by other waves adding or taking energy away by itself.
- A sound wave with larger amplitude produces a louder volume than a sound wave with smaller amplitude.
- The largeness or smallness of the wave, its amplitude, decreases as the wave travels over distances, in what is known as the Doppler Effect. This causes the volume of the sound wave to be different at different locations, even though it is the same sound wave.

**Science and Engineering Practices**

S1.B.1

**Standard**

**4.L.5** The student will demonstrate an understanding of how the structural characteristics and traits of plants and animals allow them to survive, grow, and reproduce.

**Conceptual Understanding**

**4.L.5.A** Scientists have identified and classified many types of plants and animals. Each plant or animal has a unique pattern of growth and development called a life cycle. Some characteristics (traits) that organisms have are inherited and some result from interactions with the environment.

**Performance Indicator**

**4.L.5.A.1** Obtain and communicate information about the characteristics of plants and animals to develop models which classify plants as flowering or non-flowering and animals as vertebrate or invertebrate.

**Assessment Guidance**

The objective of this indicator is to *obtain and communicate* information about the characteristics of plants and animals to develop models which classify them into groups. Therefore, the primary focus of assessment should be *to obtain and evaluate informational texts, observations, data collected, or discussions to 1) generate and answer questions, 2) understand phenomena, 3) develop models, or 4) support explanations, claims, or designs to classify plants as flowering or non-flowering and animals as vertebrate or invertebrate, and to communicate observations and explanations using conventions and expectations of oral and written language.* This could include but is not limited to students collecting data about animal-like creatures and using that information to classify them as vertebrate or invertebrates.

In addition to *obtaining and communicating information*, students should *ask questions; plan and carry out investigations; analyze and interpret data; use mathematics and computational thinking; engage in argument from evidence; construct explanations; develop and use models; and construct devices or design solutions.*

**Previous and Future Knowledge**

1.L.5A.1 Plant survival, growth, reproduction.

1.L.5A.2 Stages of flowering plant development

2.L.5A.1 classification of animals

6L.5B.3 Structures and functions of flowering plants

6.L.5B.4 Changes in environmental factors; growth and development of flowering plants.

6.L.4B.1 Vertebrates and invertebrates

**Essential Knowledge**

Many organisms can be divided into two groups--plants and animals--based on their physical characteristics.

- Plants can be further divided into flowering or non-flowering plants
- Animals can be further divided into vertebrates and invertebrates
- Vertebrates can be further divided into fish, amphibians, reptiles, birds, and mammals

Plants are organisms that are made of many parts and are capable of producing their own food. Many different types of plants have been identified. Some plants produce flowers while other plants do not produce flowers.

Flowering plants

- Flowering plants make seeds within their flowers

- Some plants enclose their seeds within fruits that animals like to eat. Once animals eat the fruit, they distribute the seeds when they defecate.
- Examples are fruit trees (apples, plums), tomatoes, or beans.

#### Non-flowering plants

- Non-flowering plants are those plants that make seeds within cones or produce spores instead of seeds.
- Some examples of non-flowering plants are grasses, pines, spruce, or cedar trees that produce cones. Ferns and mosses produce spores.

Animals are organisms that can be made of many parts but cannot make their own food. They must get energy from eating plants or other animals. One way that animals are classified is according to whether or not they have a backbone.

#### Vertebrates

- Animals with backbones.
- Vertebrates share other physical characteristics, for example, a protective skin covering, an inside skeleton, muscles attached to the bone, lungs or gills for obtaining oxygen from the air.

#### Invertebrates

- Animals without a backbone
- Some have a hard outer covering or a shell. Examples include insects, crabs, or clams.
- Others do not have a hard outer covering or shell. Examples include jellyfish and worms.
- Other examples of invertebrates are shrimp, crayfish, sponges, sea stars, or snails.

#### **Extended Knowledge**

- Classification of invertebrates (sponges, segmented worms, worms, echinoderms, mollusks, and arthropods)
- Differentiation between vascular (ex: trees, flowers) and non-vascular (ex: moss, algae) plants
- Identification of parts of flowering and non-flowering plants.
- Scientific classification systems (kingdom, phylum, etc)

- Photosynthesis
- Plant adaptations

**Science and Engineering Practices**

S.1.A.4

**Standard**

**4.L.5** The student will demonstrate an understanding of how the structural characteristics and traits of plants and animals allow them to survive, grow, and reproduce.

**Conceptual Understanding**

**4.L.5A** Scientists have identified and classified many types of plants and animals. Each plant or animal has a unique pattern of growth and development called a life cycle. Some characteristics (traits) that organisms have are inherited and some result from interactions with the environment.

**Performance Indicator**

**4.L.5A.3** Develop and use models to compare the stages of growth and development in various animals.

**Assessment Guidance**

The objective of this indicator is to *develop and use models* to compare the stages of growth and development in various animals. Therefore, the primary focus of assessment should be *to develop and use models to 1) understand or represent phenomena, processes, and relationships, 2) test devices or solutions, or 3) communicate ideas to others* about animals at different stages of their life cycles. This could include but is not limited to, students developing a model of the life cycle of a butterfly and a frog and then comparing the stages of growth and development in each animal.

In addition to *developing and using models*, students should be asked to *ask questions; plan and carry out investigations; analyze and interpret data; use mathematics and computational thinking; engage in argument from evidence; construct explanations; obtain, evaluate, and communicate information; and construct devices or design solutions.*

**Previous and Future Knowledge**

2.L.5A.3 stages of development of animals

6.L.4B structural and behavioral adaptations that animals use for reproduction and survival

**Essential Knowledge**

The stages of growth and development (life cycle) are not the same for all animals.

- Some animals give birth to baby animals that look like small adults. As the babies grow, they change in size. Other changes may be color, shape, or type of covering. For example, horses give birth to babies that look like small horses. Chickens lay eggs that hatch babies that look like small chickens.
- Some animals begin as an egg and then undergo changes in their life cycle. These changes may be in appearance, color, shape, or growth of new bodily structures. These changes in form are called *metamorphosis*. For example, in a beetle, the stages of metamorphosis are called egg, larva, pupa, and adult. In a grasshopper, the stages of metamorphosis are egg, young (nymph), and adult.

<b>Animal Family</b>	<b>Stages of Development</b>	<b>Examples</b>
Mammal	Young-Adult	dog, squirrel, human, whale
Reptile	Egg-Young-Adult	snake, turtle, lizard, alligator

	Young-Adult	rattlesnake (live birth)
Amphibian	Egg-Young-Adult	frog, toad, salamander
Insect	Egg-Larva-Pupa-Adult	butterfly, beetle, housefly, mosquito
	Egg-Young-Adult	grasshopper, cockroach, praying mantis
Bird	Egg-Young-Adult	chicken, robin, hawk, duck
Fish	Young-Adult	guppies, goldfish (live birth)
	Egg-Young-Adult	minnows, catfish

<ul style="list-style-type: none"> <li>• animal adaptations for environments</li> <li>• incomplete metamorphosis</li> </ul>		
<b>Science and Engineering Practices</b>		
S.1.A.2		

**Standard**

**4.L.5** The student will demonstrate an understanding of how the structural characteristics and traits of plants and animals allow them to survive, grow, and reproduce.

**Conceptual Understanding**

**4.L.5A** Scientists have identified and classified many types of plants and animals. Each plant or animal has a unique pattern of growth and development called a life cycle. Some characteristics (traits) that organisms have are inherited and some result from interactions with the environment.

**Performance Indicator**

**4.L.5A.4** Construct scientific arguments to support claims that some characteristics of organisms are inherited from parents and some are influenced by the environment.

**Assessment Guidance**

The objective of this indicator is to *construct scientific arguments to support claims* that some characteristics of organisms are inherited from parents and some are influenced by the environment. Therefore, the primary focus of assessment should be for students to *construct scientific arguments to support claims, explanations, or designs using evidence from observations, data, or informational texts* regarding how some characteristics of organisms are influenced by environmental factors such as temperature, nutrition, exposure to sunlight, disease, injury and living condition while other characteristics are inherited. This could include but is not limited to students observing pictures of arctic foxes in different seasons and being prompted to make a claim and provide evidence for their claim regarding when and why the fox's fur changes from brown to white.

In addition to *constructing scientific arguments from evidence*, students should be asked to *ask questions; plan and carry out investigations; analyze and interpret data; use mathematics and computational thinking; construct explanations; obtain, evaluate, and communicate information; develop and use models; and construct devices or design solutions.*

**Previous and Future Knowledge**

2.L.5A.1 Animal classification by physical characteristics (mammals, birds, amphibians, reptiles, fish, insects)

3.L.5A.1 Physical factors (light, temperature, water, soil, and space for shelter and reproduction) of environments (salt water, fresh water, deserts, grasslands, forests, rainforests, polar regions)

6.L.4B Structural adaptations

7.L.4A Alleles, genes and chromosomes

**Essential Knowledge**

Some characteristics of organisms are inherited from parents and some are influenced by the environment.

**Physical Characteristics:**

Some physical characteristics of organisms are passed from parents to their offspring (inherited).

- Inherited traits may help distinguish one organism from another.
- Some examples of animal characteristics may be type and color of body coloring, type and shape of sensory organs, or body structure.
- Some examples of plant characteristics may be shape of leaves, color of flowers, or type of fruit.

Some characteristics of organisms are influenced by environmental factors. These factors

include: temperature, nutrition, exposure to sunlight, disease, injury and living conditions

- Traits influenced by the environment do not change the organism into another kind of organism.
- Traits influenced by the environment are not usually passed on to offspring.
- Temperature can change the size and thickness of a plant's leaves.
- Animals may experience a change in fur thickness in response to temperature fluctuations.
- Animals' coats may also change color in response to the seasons.
- A lack of nutrients may make plants and/or animals experience stunted growth and make them vulnerable to sickness.
- Injuries to plants and animals may produce scarring.
- Changes in the amount of sunlight may affect the size and growth rate of plants. It may also cause changes in skin color of humans and other animals.

**Extended Knowledge**

- Traits as a function of genetics
- Specific tropisms or dormancy in plants

**Science and Engineering Practices**

S.1.A.7

**Standard**

**4.L.5** The student will demonstrate an understanding of how the structural characteristics and traits of plants and animals allow them to survive, grow, and reproduce.

**Conceptual Understanding**

**4.L.5B** Plants and animals have physical characteristics that allow them to receive information from the environment. Structural adaptations within groups of plants and animals allow them to better survive and reproduce.

**Performance Indicator**

**4.L.5B.1** Develop and use models to compare how humans and other animals use their senses and sensory organs to detect and respond to signals from the environment.

**Assessment Guidance**

The objective of this indicator is to *develop and use models* to compare how humans and other animals use their senses and sensory organs to detect and respond to signals from the environment. Therefore, the primary focus of assessment should be to *develop and use models to 1) understand or represent phenomena, processes, and relationships, 2) test devices or solutions, or 3) communicate ideas to others* about how humans and animals sense and respond to changes in their environment. This could include but is not limited to students developing visual models to communicate the cause and effect relationship between humans' and other animals' use of hearing to sense approaching danger and their responses to danger.

In addition to *developing and using models*, students should be asked to *ask questions; plan and carry out investigations; analyze and interpret data; use mathematics and computational thinking; engage in argument from evidence; construct explanations; obtain, evaluate, and communicate information; and construct devices or design solutions.*

**Previous and Future Knowledge**

K.L.2A.4 Senses and sensory organs (eyes, nose, ears, tongue, skin)  
6.L.4B Animal Response  
7.L.3B.2 Human body systems.

**Essential Knowledge**

Animals, including humans, have sensory organs that allow them to detect and respond to signals from the environment. After these signals are detected, the organism responds with certain behaviors. A *behavior* is a response to a change in the environment.

*Senses* tell animals what they need to know about their environment.

- Sensory organs are any part of the body that receives signals from the environment.
- They help to keep animals out of danger and enable them to find food and shelter.
- Many animals have the same type of sense organs as humans.

In general, every animal has the senses it needs for its own environment and way of life.

However, some animals need different information about their environment to survive. They may have sharper senses than others. For example:

- Dogs have a very strong sense of smell
- Some animals like bats can use echolocation
- Many small mammals can see in very low light conditions
- Some aquatic animals use electric sensation
- Some migratory animals may be able to use magnetism from the Earth to navigate

\*See the chart below

<b>Senses</b>	<b>Signals Detected</b>	<b>Examples of Sensory Organs in Humans and Other Animals</b>	<b>Examples of Behaviors of Humans and Other Animals</b>
Sight	detects colors, shapes, sizes, space/distance, light, movement	humans have eyes; other animals' eyes may differ in type, number, and location on the body	locate food or shelter; recognize objects or other organisms.
Hearing	receives vibrations, detects sound	humans have ears; other animals' hearing organs may differ in type, number, and location on the body	Locate food; sense danger to escape enemies; communication
Taste	detects flavors; humans detect salty, sweet, bitter, and/or sour tastes	Humans have taste buds on tongues; other animals' taste organs differ in type and in location on the body	Judge which foods are safe to eat
Smell	detects odors	humans have a nose; other animals' smelling organs differ in type and in location on the body	avoid danger; find food; recognize other organisms
Touch	detects shapes, size, temperature, texture, pain, vibrations, pressure	humans have a skin; other animals' touching organs differ in type and location on the body	identify food; react to dangerous situations; care for each other; communication

**Extended Knowledge**

- Anatomy of the structures of the five sensory organs in humans
- Functioning of the central nervous system

**Science and Engineering Practices**

S.1.A.2

**Standard**

**4.L.5** The student will demonstrate an understanding of how the structural characteristics and traits of plants and animals allow them to survive, grow, and reproduce.

**Conceptual Understanding**

**4.L.5B** Plants and animals have physical characteristics that allow them to receive information from the environment. Structural adaptations within groups of plants and animals allow them to better survive and reproduce.

**Performance Indicator**

**4.L.5B.2** Construct explanations for how structural adaptations (such as the types of roots, stems, or leaves; color of flowers; or seed dispersal) allow plants to survive and reproduce.

**Assessment Guidance**

The objective of this indicator is to *construct explanations* for how structural adaptations allow plants to survive and reproduce. Therefore, the primary focus of assessment should be for students to *construct explanations using 1) scientific evidence and models, 2) conclusions from scientific investigations, 3) predictions based on observations and measurements, or 4) data communicated in graphs, tables, or diagrams* to show how plant structures (such as the types of roots, stems, or leaves; color of flowers; or seed dispersal) assist plants in meeting their needs for survival within their environment. This could include but is not limited to students collecting data after observing the root growth of different varieties of plants and reasoning with their data to construct an explanation about how different types of roots help plants survive in a variety of habitats.

In addition to *constructing explanations*, students should *ask questions; plan and carry out investigations; analyze and interpret data; use mathematics and computational thinking; engage in argument from evidence; obtain, evaluate, and communicate information; develop and use models; and construct devices or design solutions.*

**Previous and Future Knowledge**

K.L.2A.2 Conduct structured investigations to determine what plants need to live and grow (including water and light).

1.L.5B.3 Analyze and interpret data from observations to describe how changes in the environment cause plants to respond in different ways (such as turning leaves toward the Sun, leaves changing color, leaves wilting, or trees shedding leaves).

**Essential Knowledge**

Plants are adapted to their habitats so that their needs can be met. Some plants have special structural *adaptations* for meeting their needs in their particular habitat. Some examples of plant adaptations to conditions in their habitat may be:

**Roots**

- Roots take in water and nutrients from the habitat.
- They may also hold the plant in place and store food and water.
- Each variety of plant will survive where its roots' size, length, and spread are adapted to the habitat.
- Some examples of root adaptations may be:
  - Water lilies have long roots that can take in nutrients from the muddy bottom of

ponds or lakes.

- Cacti have roots that spread out close to the surface for living in dry habitats.
- Carrots and dandelions have a large, thick root that is longer than its other roots. This long root helps the plant survive by reaching far underground to find water and to firmly anchor the plant.

#### Stems

- Stems move and store water and nutrients in the plant. Stems also provide support and protection for the plant. Some examples of stem adaptations may be:
  - Vines have stems that can climb and stick to various surfaces to ensure that the leaves are exposed to light.
  - Corn and sunflowers have stems that grow thick and strong but remain green and flexible so that they can grow toward the sun
  - Trees develop woody stems (and trunks) to support their size and provide protection against wind and physical damage during their long lifetime.
  - Cacti have thick stems that store water when the habitat does not provide it.
  - Some stems have thorns that provide protection

#### Leaves

- Leaves produce food for plants in the presence of light.
- Each variety of plant will survive where its leaf size, texture, thickness, and shape are adapted to the habitat.
- Some examples of leaf adaptations may be:
  - Water lilies develop wide leaves that allow them to float on the water to capture sunlight to make food.
  - Evergreen trees have leaves that are thin, waxy needles to protect them from freezing and from losing water.

#### Flowers

- Flowers often have special sizes, shapes, smells, or colors that attract organisms for pollination.

#### Fruit

- Fruits are formed around the seed to protect it. Some examples of fruit adaptations may be:
  - Some fruits are moist and fleshy (tomatoes, grapes, or peaches). Fleshy fruits attract animals that eat them, helping to disperse the seeds.
  - Other fruits are dry and/or hard (coconuts, pecans, pea pods)

#### Seeds

- Some seeds begin to grow as soon as conditions allow for germination
- Seeds have adaptations that allow them to be dispersed and to have enough food for a long period of dormancy until it germinates and begins to make its own food.
- Seeds are designed differently to be moved by wind, water, and animals.

#### Extended Knowledge

- Parts and types of leaves
- Specific structures of flowers
- How seeds are produced

#### Science and Engineering Practices

S.1.A.6

<p><b>Standard</b></p> <p><b>4.L.5</b> The student will demonstrate an understanding of how the structural characteristics and traits of plants and animals allow them to survive, grow, and reproduce.</p>
<p><b>Conceptual Understanding</b></p> <p><b>4.LB.5</b> Plants and animals have physical characteristics that allow them to receive information from the environment. Structural adaptations within groups of plants and animals allow them to better survive and reproduce.</p>
<p><b>Performance Indicator</b></p> <p><b>4.L.5B.3</b> Construct explanations for how structural adaptations (such as methods for defense, locomotion, obtaining resources, or camouflage) allow animals to survive in the environment.</p>
<p><b>Assessment Guidance</b></p> <p>The objective of this indicator is to <i>construct explanations</i> for how structural adaptations allow animals to survive in the environment. Therefore, the primary focus of assessment should be for students to <i>construct explanations using 1) scientific evidence and models, 2) conclusions from scientific investigations, 3) predictions based on observations and measurements, or 4) data communicated in graphs, tables, or diagrams</i> to explain how structures for defense, locomotion, obtaining resources, or camouflage affect an animal’s ability to survive in its habitat. This could include but is not limited to students observing moths and frogs in their environments and using data collected from their observations to support claims about how animals use camouflage to survive.</p> <p>In addition to <i>constructing explanations</i>, students should be asked to <i>ask questions; plan and carry out investigations; analyze and interpret data; use mathematics and computational thinking; engage in argument from evidence; obtain, evaluate, and communicate information; develop and use models; and construct devices or design solutions.</i></p>
<p><b>Previous and Future Knowledge</b></p> <p>2.L.5A.2 structures for seeing, hearing, grasping, protection, locomotion, and obtaining/using resources help animals survive</p> <p>3.L.5B.2 changes in the environment cause plants and animals to respond in different ways</p> <p>8.E.6B.1 biological adaptations enhance the probability of an animal’s survival.</p>
<p><b>Essential Knowledge</b></p> <p>Animals are adapted to their habitat so that their needs can be met. Some adaptations of animals can help them find food or water, protect them from danger, or help them survive when conditions in the environment change. These adaptations include:</p> <p><b>Defense</b></p> <ul style="list-style-type: none"> <li>● Some animals have physical adaptations to protect themselves from being hurt, killed, or eaten. These adaptations include quills, claws, fangs, or spraying scent glands and warning stripes in skunks.</li> </ul> <p><b>Locomotion</b></p> <ul style="list-style-type: none"> <li>● In order for animals to find the resources they need for food, shelter, or space, they must be able to move around.</li> <li>● Animals have special structures for moving, depending on where they live. <ul style="list-style-type: none"> <li>○ Above ground: swinging (monkey tails), climbing and traction (squirrel claws),</li> </ul> </li> </ul>

- and flying (bird wings)
- On the ground: crawling (webbed lizard feet), walking (dog paws, donkey hooves), or hopping (grasshopper legs)
- In the water: floating (jellyfish), swimming (fish fins), or diving (dolphin and penguin flippers)
- Whiskers are used for feeling in many animals. For example, a fox uses its whiskers to determine if it can move into a tight space or if there is enough space to move. Otters use their whiskers for the same purpose, but underwater.

#### **Obtaining resources**

- Animals have special structures used for obtaining and eating food.
  - For example, the beaks of birds are shaped according to the available food
  - Mouths of insects are often elongated to reach nectar within flowers
  - Teeth or claws are shaped in different ways depending on the type of food they can eat.

#### **Camouflage**

- Camouflage is a color or pattern that allows an animal to blend into its environment and protects it from being seen by its enemies or allows it to sneak up more easily on its food.
  - Tigers have vertical stripes that help them blend into the grassland areas in which they live.
  - The macaw uses its brightly colored feathers to hide among brightly colored plants in the rainforest.

#### **Extended Knowledge**

- Behavioral adaptations of animals

#### **Science and Engineering Practices**
